Executive Summary

Objectives

Waterman Infrastructure & Environment Limited ("Waterman") was instructed by Jupiter Friars Ltd to undertake a Preliminary Environmental Risk Assessment for potential ground contamination to support the full planning application for the redevelopment of 41 – 45 Blackfriars Road, London (hereafter termed "the Site").

Site Setting

Current Use	The Site is currently a nine storey office block with basement and internal ground level car parking.
History	The Site is shown to be occupied by terraced properties from the date of the first available maps. The centre of the Site undergoes development prior to the late 1800s which includes high density buildings of unknown use. By 1916, a smithy is denoted as being present in the north of the Site. A large area of the Site appears to have been cleared prior to 1938 which later becomes developed as terraced properties in the south of the Site with a depot located in the centre of the Site. The depot is later denoted as a warehouse. The Site undergoes redevelopment with Friar's Bridge Court denoted on mapping from 1991.
Geology	The geology underlying the Site recorded to comprise of a significant thickness of alluvial deposits (sand, silt, clay and peat), underlain by the London Clay Formation. There is likely to be a thickness of Made Ground at the Site.
Controlled Waters	The Site is underlain by a Secondary Undifferentiated aquifer associated with the alluvial deposits. The River Thames is located 337m north of the Site.
Consultation	Consultations have been requested from the Environmental Health Officer and Building Control departments at Southwark Council. However, written responses are currently pending.

Preliminary Conceptual Model

Based on the Preliminary Conceptual Site Model, potentially unacceptable pollutant linkages have been identified as follows:

- Construction workers may be exposed to contaminants in shallow soils and groundwater beneath the Site;
- Future Site users / offsite residents may be exposed to ground gas generated beneath the Site;
- Shallow contaminants may pose a risk to buried services and structures; and
- Contaminants in Made Ground may impact upon the Secondary Undifferentiated aquifer via leaching.

Conclusions

The Preliminary Conceptual Site Model indicated that the highest risk estimated for potential pollutant linkages was Medium. This rating was given to three of seven potential pollutant linkages.

The proposed development of the Site will consist of the demolition of the existing building and the building of a new high-quality commercial building for office use, given this the overall risk rating for the Site is considered to be Medium.

The recommendations of this report outline preliminary remedial and mitigation measures that require confirmation through additional works. However, once successfully implemented the risks are anticipated to be Low. Therefore the NPPF requirement that on completion the Site can no longer be captured under the Part IIA regime is expected to be met.

Recommendations

The following actions are recommended to address the potentially unacceptable risks identified:

- An intrusive investigation and assessment of the Site is recommended, which should include soil sampling, ground gas monitoring, groundwater sampling. This will enable an assessment to be made on whether contaminants present on Site pose a potential risk to human health or controlled waters;

Recommendations

- A geotechnical investigation and assessment should be completed in tandem with the intrusive investigation to inform foundation design. Sulphate and pH testing should also be incorporated into the geotechnical investigation, to inform the design of buried concrete against chemical attack;
 - A number of ruins were visible in the surrounding area of historical mapping. As a result, a desk-based unexploded ordnance (UXO) assessment should be undertaken to determine the risk to ground works. Notwithstanding, a basement is present beneath large areas of the Site, which could reduce this risk within this area of the Site, however, a theoretical risk to piling and site investigation activities remains;
 - A Remediation Strategy is likely to be required as a condition of planning, this will outline the mitigation measures required to mitigate the risks to human health and/or controlled waters. The remediation strategy should be compiled by a suitably qualified professional, and followed by a corresponding verification report;
 - Due to the age of the building it is likely that potential Asbestos Containing Materials are present within the building and below ground services. A suitable asbestos survey should be undertaken prior to the buildings demolition;
 - The Secondary Undifferentiated aquifer is present at shallow depths beneath the Site. Consequently care should be taken not to introduce contamination to the ground during the construction works at the Site; and,
 - In the event that materials are to be excavated for re-use on Site or off-site disposal, a preliminary waste classification assessment should be undertaken. Waste acceptance criteria (WAC) testing may then be necessary, where disposal is proposed.
-

1. Introduction

1.1 Objectives

Waterman Infrastructure & Environment Limited (“Waterman”) was instructed by Jupiter Friars Ltd to undertake a Preliminary Environmental Risk Assessment for potential ground contamination for the proposed planning application of 41-45 Blackfriars Road, London, SE1 8NZ (hereafter termed “the Site”).

1.2 The Proposed Development

The planning application seeks full planning permission for:

“Demolition of existing office (Class B1a) building and redevelopment to provide a part 12, part 20 storey building plus basement comprising offices (Class B1a) with retail (Classes A1/A3 and A4) together with servicing, car parking and landscaping.”

The proposed development will play an important role at a regional and local level by providing modern commercial floorspace for London. The proposed Development comprises 26,158 sqm office (B1) and 594 sqm (A1- A4) of flexible retail floorspace (GIA). The building has been articulated into three blocks to break up the building’s facades and comprises of part 12 and part 20 storey building plus basement.

The proposed development will repair the poor quality of the public realm and streetscape on the edges of the site. The proposal will enhance and activate the public realm at the base of the proposed building. An office entrance and a new retail unit would front onto Blackfriars Road. Further retail units are provided to Meymott Street and Colombo Street, with the latter fronting onto an extended area of public realm on Colombo Street. The scheme will change Colombo Street from a purely transitional and functional space to a place where people would wish to sit and dwell. The footway on the north side of Meymott Street would be widened enhancing the quality of the pedestrian route.

1.3 Regulatory Context

The National Planning Policy Framework (NPPF) sets out Government planning policy for England and how this is expected to be applied to development. Paragraphs 120 to 122 of Section 11 – Conserving and enhancing the natural environment of the NPPF relate to contaminated land matters and state the following:

“To prevent unacceptable risks from pollution and land instability, planning policies and decisions should ensure that new development is appropriate for its location. The effects (including cumulative effects) of pollution on health, the natural environment or general amenity, and the potential sensitivity of the area or proposed development to adverse effects from pollution, should be taken into account. Where a site is affected by contamination or land stability issues, responsibility for securing a safe development rests with the developer and/or landowner.

Planning policies and decisions should ensure that:

- *the site is suitable for its new use taking account of ground conditions and land instability, including from natural hazards or former activities such as mining, pollution arising from previous uses and any proposals for mitigation including land remediation or impacts on the natural environment arising from that remediation;*
- *after remediation, as a minimum, land should not be capable of being determined as contaminated land under Part IIA of the Environmental Protection Act 1990; and*

- Adequate site investigation information, prepared by a competent person, is presented.

In doing so, local planning authorities should focus on whether the development itself is an acceptable use of the land and the impact of the use, rather than the control of processes or emissions themselves where these are subject to approval under pollution control regimes. Local planning authorities should assume that these regimes will operate effectively. Equally, where a planning decision has been made on a particular development, the planning issues should not be revisited through the permitting regimes operated by pollution control authorities.”

In order to assess the contamination status of the Site, with respect to the proposed end use, it is necessary to assess whether the Site could potentially be classified as “Contaminated Land”, as defined in Part IIA of the Environmental Protection Act 1990 and Contaminated Land Statutory Guidance 2012. This is assessed by the identification and assessment of potential pollutant linkages. The linkage between the potential sources and potential receptors identified needs to be established and evaluated.

To fall within this definition, it is necessary that, as a result of the condition of the land, substances may be present in, on or under the land such that:

- a) significant harm is being caused or there is a significant possibility of such harm being caused; or
- b) significant pollution of controlled waters is being caused, or there is significant possibility of such pollution being caused.

It should be noted that DEFRA has advised (Ref. Section 4, DEFRA Contaminated Land Statutory Guidance 2012) Local Authorities that land should not be designated as “Contaminated Land” where:

- a) the relevant substance(s) are already present in controlled waters;
- b) entry into controlled waters of the substance(s) from land has ceased; and
- c) it is not likely that that further entry will take place.

These exclusions do not necessarily preclude regulatory action under the Environmental Permitting (England and Wales) Regulations 2010, which make it a criminal offence to cause or knowingly permit a water discharge of any poisonous, noxious or polluting matter to controlled waters. In England and Wales, under The Water Resources Act 1991 (Amendment) (England and Wales) Regulations 2009, a works notice may be served by the regulator requiring appropriate investigation and clean-up.

1.4 Constraints

The assessment was undertaken in accordance with the scope agreed between Waterman and Jupiter Friars Ltd, as documented in Waterman’s fee letter (EED15605-100-F-001-SB_BAO, dated 5 June 2015), and with Waterman’s standard Terms of Appointment.

The benefit of this report is made to Jupiter Friars Ltd.

The information contained in this report is based on a review of available historical, geological and hydrogeological sources, consultation with the regulatory authorities and observations made on site on 17 July 2015.

Waterman has endeavoured to assess all information provided to them during this investigation, but makes no guarantees or warranties as to the accuracy or completeness of this information.

The scope of this investigation does not include an assessment for the presence of asbestos containing materials within or below buildings or in the ground at the Site.

The conclusions resulting from this study are not necessarily indicative of future conditions or operating practices at or adjacent to the Site.

2. Methodology

This Preliminary Environmental Risk Assessment has been undertaken in general accordance with the Model Procedures for Management of Land Contamination (Contaminated Land Report 11 – Environment Agency, September 2004).

The report includes the following:

- Collation of available documentary information;
- Consultation with relevant regulatory bodies including Southwark Council Environmental Protection, Planning Department, and Building Control Department;
- A Site reconnaissance;
- Hazard identification;
- Formulation of a Preliminary Conceptual Model for the Site;
- Hazard assessment for the identification of potentially unacceptable risks; and
- Recommendations for further action.

3. Previous Environmental Assessments

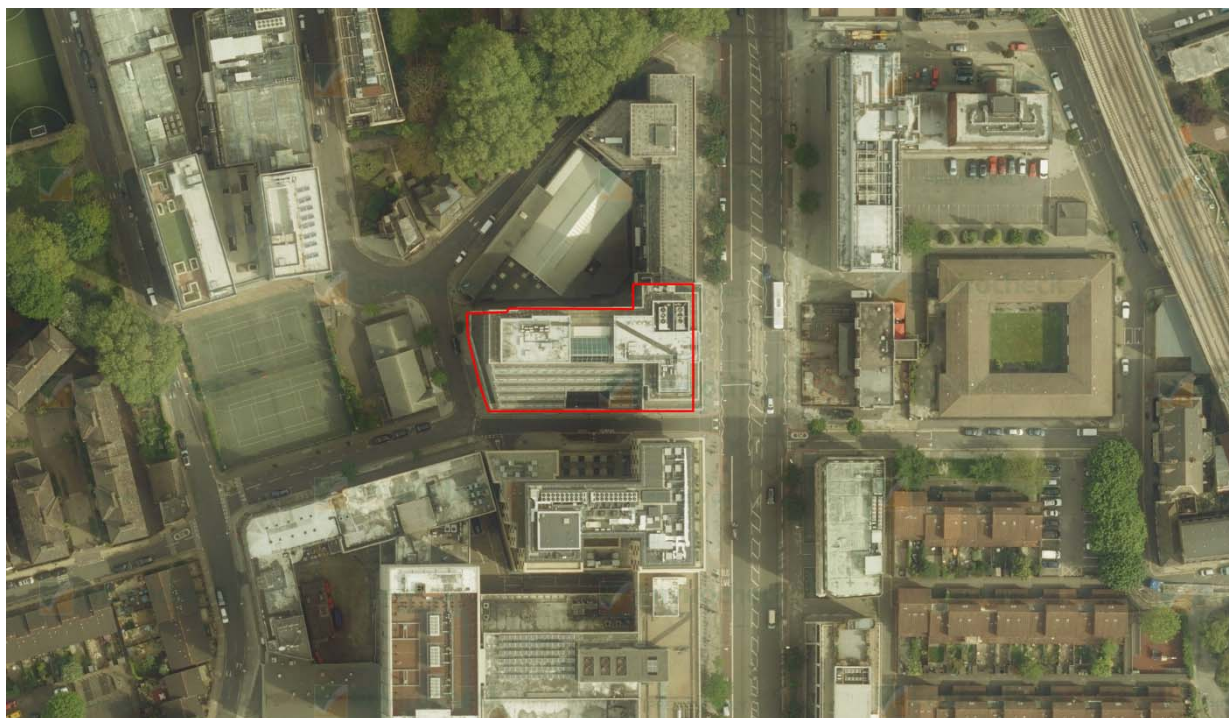

No previous environmental assessments have been made available for review with regard to this Site.

4. Hazard Identification

4.1 Site Description and Reconnaissance

The Site is located at National Grid Reference 531610, 180200 on Blackfriars Road, in the Southwark area of London. A site location plan (Ref. WIB15605-100_GR_PERA_A1A) is presented in Appendix A. Figure 1 presents the current Site Layout.

Figure 1: Current Site Layout

Source: Landmark Envirocheck Report (Ref. 69899465_1_1)

A Site walkover was undertaken on 17 July 2015. At the time of the walkover the Site was fully operational, with all floors occupied as office space. The walkover was undertaken along with the facilities manager.

The Site comprises 9 floors, with the basement level and 9th floor both containing plant used to service the whole building.

The basement level contained a sprinkler tank room, a high voltage transformer and a switch room. A generator room housed 1No. generator which is used for backup purposes only and provides electricity should there be a power failure. The generator was stood upon a raised concrete base and stood within a concrete bund. 4No. 250 litre diesel oil drums and 3No. small plastic containers were also located within the generator room, which were in good condition and stood on concrete hardstanding. There was no visual or olfactory evidence of contamination identified. The concrete hardstanding throughout the basement space was in good condition, with no cracks, or signs of degradation noted.

A disused kitchen was also present within the basement space, however at the time of the walkover this was disused and the gas pipes disconnected.

The 1st floor to the 8th floor are utilised for office space which are currently occupied.

Plant on the 9th floor consisted of a ventilation unit, lift motor room (with no diesel oil storage present), an air extraction unit and a condensing unit. No stains or leaks were apparent on the concrete hardstanding.

The ground floor was predominantly in use as an internal carpark, with 8 car parking spaces. A small cleaner's room was present with a small storage of domestic cleaning chemicals, which were raised above the floor on designated shelving units. The room was contained within a concrete bund, which was set just below the level of the carpark. The hardstanding was in good condition with no visual or olfactory evidence of contamination. The ground floor space was also used for bin and bicycle storage. No oil/water interceptors were present on the site, but the facilities manager did advise that a sump was present.

In the south east corner, it is understood that no basement exists. The facilities manager confirmed that this corner was inaccessible and has been blocked off by a concrete wall. It is unknown why this designed no as-built plans are available.

On the western face of the building fronting Colombo Street an Electrical Sub-Station was located. Surrounding site uses consisted of a public house, office buildings and a doctor's surgery. There was no soft landscaping present surrounding the Site.

According to the Landmark EnviroCheck report, there are no licences or consents registered to the property.

It should be noted that the following Pollution, Prevention and Control licenses, discharge consents, licensed waste management facilities and registered radioactive substances are now covered by Environmental Permits:

- Integrated Pollution, Prevention and Controls (IPPC): Environmental Permit for a Part A(1) Activity;
- Local Authority IPPC (LA-IPPC): Environmental Permit for a Part A(2) Activity;
- Local Authority Pollution, Prevention and Controls (LAPPC): Environmental Permit for a Part B Activity;
- Licensed Waste Management Facilities: Environmental Permit for waste activities;
- Registered Radioactive Substances: Environmental Permit relating to radioactive substances;
- Discharge Consents: Environmental Permit for discharges to groundwater/surface water.

A site features plan (Ref. WIB15605-100_GR_PERA_A4A) is presented in Appendix A. A selection of photographs taken during the site inspection is presented as Appendix B.

4.1.1 Site Surroundings

A summary of the current surrounding land uses, including relevant licences and consents, is shown in Table 1.

Table 1: Summary of surrounding land uses

Location	Description
North	Commercial Properties. A local authority pollution prevention and control permit is in place for Prestige Dry Cleaners located 226m north.
East	Blackfriars Road, Commercial Properties. Two permits for Registered Radioactive Substances at Bureau Veritas UK Ltd located 496m east.
South	Meymott Street, Commercial Properties. A local authority pollution prevention and control permit is in place for Panbros Cleaners located 303m southwest.

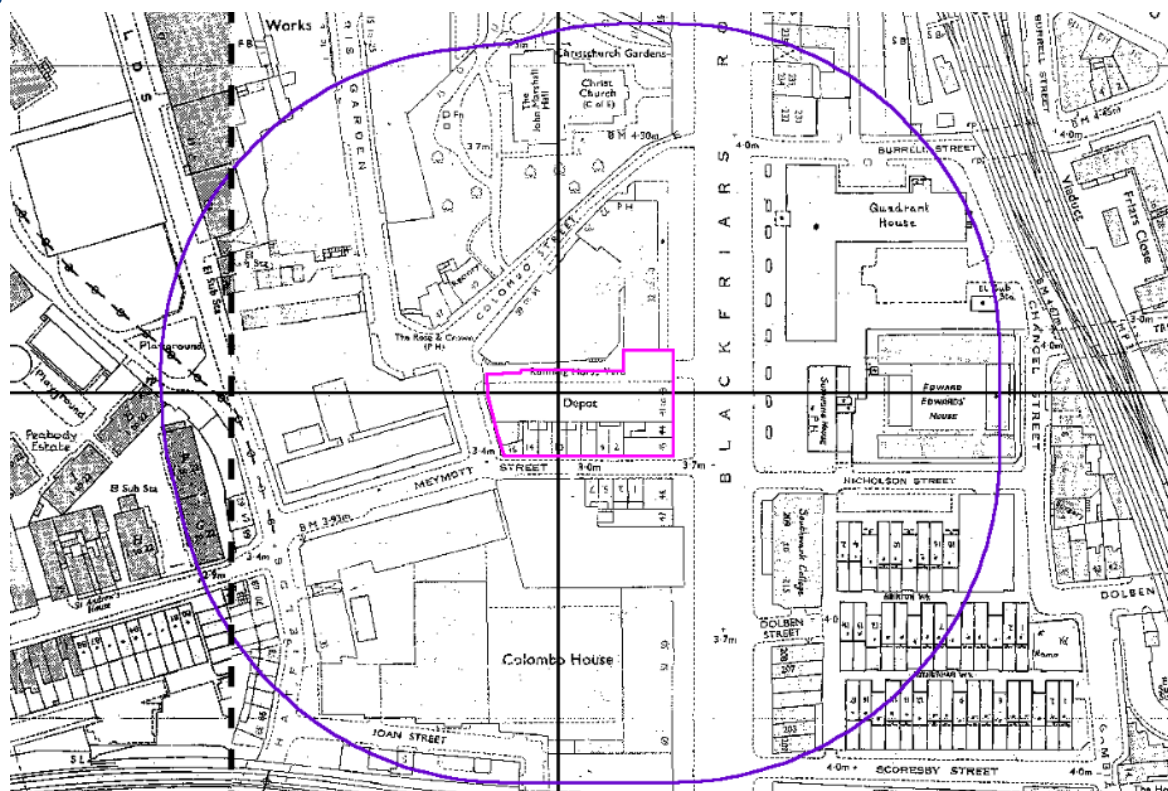

Location	Description
West	Colombo Street, Commercial Properties. Two permits are in place for Registered Radioactive Substances at King's College London located 492m west.

All environmental permits for discharge consents are discussed within Section 4.4. There are no other records of Environmental Permits, COMAH, NIHHS, Radioactive substances, Planning Hazardous Substances Consents, Licensed Waste Management Facilities and landfills within a 500m radius of the Site.

4.2 History

A review of historical maps obtained from Landmark Information Group Historical Maps has been undertaken. Figure 2 presents the 1962 to 1990 historical map.

Figure 2: Historical Site Use

Source: Additional SIMs (1962 – 1990). Landmark Envirocheck Report Ref. 69899465_1_1

In summary, the Site is shown to be occupied by terraced properties from the date of the first available maps. The centre of the Site undergoes development prior to the late 1800s which includes high density buildings of unknown use. By 1916, a smithy is denoted as being present in the north of the Site. A large area of the Site appears to have been cleared prior to 1938 which later becomes developed as terraced properties in the south of the Site with a depot located in the centre of the Site. The depot is later denoted as a warehouse. The Site undergoes redevelopment with Friar's Bridge Court denoted on mapping from 1991.

Table 2 summarises the relevant information in chronological order.

Table 2: Site history

Source	Site ^a	Surroundings ^a
OS Map Published by London, 1878 - 1879, 1:2,500	The Site is occupied by terraced properties, assumed to widely be in residential use. The terrace is positioned along the west, southern and eastern site boundaries. A public house is present in the east of the Site. Running Horse Yard is denoted to the north and extending on-site.	The Site is surrounded by high density buildings likely to widely be in residential use. Stables are located 10m north of the Site. A disused grave yard , associated with Christ Church, is located 40m to the north of the Site. A saw mill is present 130m north of the Site. Two railway lines are located 150m east of the site and 100m south of the Site. A lead works is present 150m east of the Site. A saw mill is located 45m south of the Site. A works is present 230m west of the Site.
OS Map Published by London, 1896, 1:2,500	The Site is occupied by approximately 20 units within terraced buildings. Stables are recorded to be present in the north of the Site. The centre of the Site remains undeveloped.	A yard with stables are denoted adjacent to the northern site boundary. A goods station associated with the railway line to the east is present 240m north of the Site. A timber yard is present 200m southeast of the Site. A timber yard is denoted 155m west of the Site. The two saw mills are no longer denoted.
OS Map Published by London, 1916, 1:2,500	The centre of the Site appears to have been cleared. A smithy is present in the north of the Site extending offsite to the north.	Two printing works are present 115m northwest of the Site with an additional printing works located 50m beyond.
OS Map Published by Ordnance Survey Plan, 1951-1952, 1:1,250	The north of the Site appears to be undeveloped. A row of terraced properties are present in the south of the Site.	Waterloo Junction Station is denoted 200m southwest of the Site. Christ Church located approximately 70m to the north is denoted as a ruin . Ruins are denoted 80m and 115m northeast of the Site. The two printing works to the northwest of the Site have been combined and extended to 60m northwest of the Site. An engineering works is noted 100m northwest of the Site. A further printing works is denoted 130m northwest of the Site.
OS Map Published by Ordnance Survey Plan, 1958-1967, 1:1,250	The north of the Site is denoted as a Depot .	A depot is denoted 120m north of the Site. A factory is denoted 50m north of the Site. A works is denoted 70m northeast, 150m east, 130m southeast and 70m south of the Site. Waterloo Junction Station is no longer denoted. The large printing works and the engineering works to the northwest of the Site are now denoted as three individual works.
OS Map Published by Ordnance Survey Plan, 1962-1990, 1:1,250	There are no significant changes denoted.	The works to the south of the Site is no longer denoted. The good shed to the northeast of the Site was no longer denoted between 1967 and 1976. An area 50m to the east of the Site, formerly comprising of terraced properties, has been cleared.
OS Map Published by Ordnance Survey Plan, 1982-1983, 1:1,250	The Depot in the north of the Site is now denoted as a Warehouse .	An area adjacent to the west of the Site has been cleared.

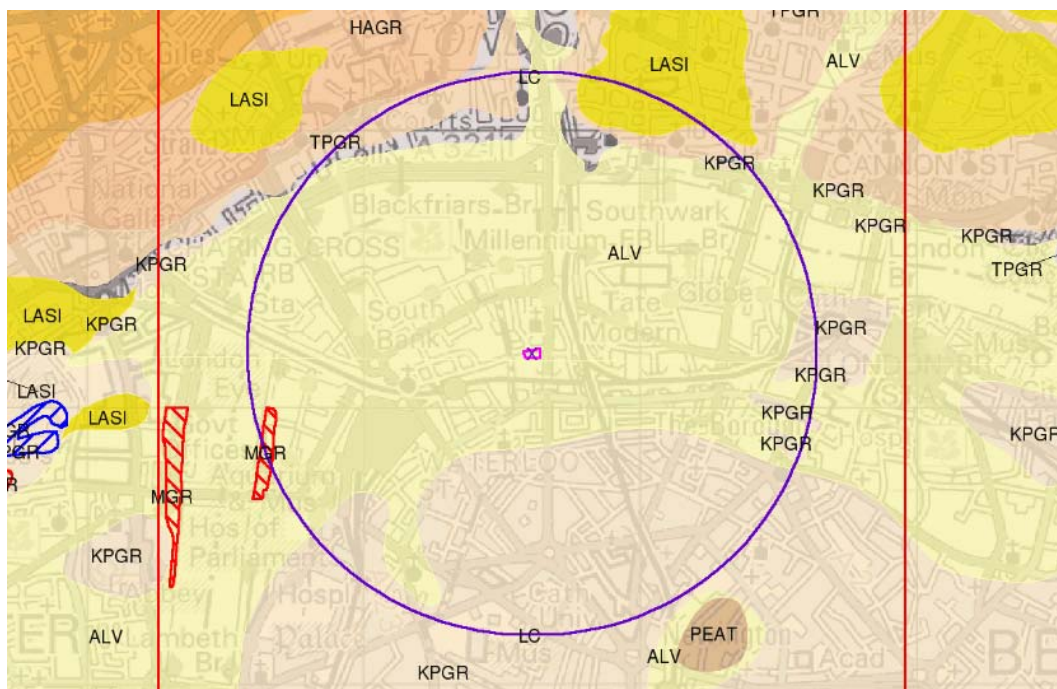

Source	Site ^a	Surroundings ^a
OS Map Published by Large Scale National Grid Data, 1991-1995, 1:1,250	The Site is now denoted as Friar's Bridge Court with the building footprint covering the Site in its entirety.	The yard to the north of the Site is now denoted as a Sport and Community Centre. The three works to the northwest of the Site are no longer denoted as works.
10k Raster Map 2006, 1:10,000 VectorMap Local 2015, 1:10,000	There are no significant changes denoted.	There are no significant changes denoted.

^a potentially contaminative uses are shown in bold italics.

4.3 Geology

The geology beneath the site has been established from the British Geological Survey (BGS) 1: 50,000 scale Geological Map, Sheets 270 and 256, and the BGS website (accessed online 27/07/2015) and is shown in Figure 3 below.

Figure 3: Geology

Source: Combined Geology – Landmark Envirocheck Report Ref. 69899465_1_1

A summary of the geology is provided in Table 3:

Table 3: Site geology

Stratum	Area Covered	Estimated Thickness	Typical Description
Made Ground	Whole Site	Unknown	Concrete over hard core with fill likely to comprise of demolition rubble containing brick and concrete.
Alluvium	Whole Site	Up to 15m	Clay, Peat, Sand and Silt
London Clay Formation	Whole Site	Unproven	Clay and Silt

The Site has been developed from the late 19th century and has undergone multiple stages of redevelopment. Given this, it is likely that Made Ground is present at the Site, however, the depth and composition is unknown.

The BGS online borehole database has been reviewed and borehole logs in the vicinity of the Site have been consulted, which reveal that alluvium at the Site is likely to be present up to 15m in thickness and are underlain by an unknown thickness of London Clay Formation.

4.3.1 Ground Stability

The Envirocheck Bedrock and Faults Map (Ref. 69899465_1_1) reveals that there are no structural, geomorphological or geochemical features on or near to the Site.

There is no to very low hazard potential for ground dissolution, shrinking or swelling clay, collapsible ground, landslide, and running sand ground stability hazards at the Site. There is considered to be a moderate risk from compressible ground stability hazards at the Site.

The Site is not in an area that could be affected by coal mining activity.

4.3.2 Ground Gas

According to information from the Health Protection Agency, the Site is not located in an area of elevated radon gas levels (a naturally occurring gas). Consequently, radon protection measures are not required in the development of new buildings or extensions.

Discussions within the industry centre around the possibility that radon protection measures should be considered in all new buildings whether located in a radon affected area or not. This approach should be confirmed with the Building Control Officer.

There are no registered landfills within 500m of the subject site, which may be a source of both off-site contamination and ground gas.

4.4 UXO Risk

An Unexploded Ordnance Threat and Risk Assessment Report has been produced by Alpha Associates Ltd (Ref. P4975) which revealed a medium to high risk. The report highlights the most probably UXO threat to be from WWII German HE bombs, whilst IBs and British AAA projectiles may also pose a threat. The Site was highly developed during WWII so it is considered unlikely that UXOs would have gone unreported, however, the Site sustained serious bomb damage during WWII, therefore it is considered plausible for UXB entry hole to have been concealed by bomb damage. The potential for UXO to be present below the

buildings existing foundations is assessed to be extant. However, areas that have not been previously excavated in particular the southeastern aspect may still hold a risk of UXO.

Mitigation measures are considered necessary and are recommended to include an operational UXO Risk Management Plan, UXO Safety & Awareness Briefings, EOD Banksman Support, and where piling is to be undertaken in previously undisturbed ground, an Intrusive Magnetometer Survey. For full details of the UXO risk and the recommended mitigation measures please refer to the Detailed Unexploded Ordnance (UXO) Threat & Risk Assessment, presented in Appendix D.

Controlled Waters

4.4.1 Surface Waters

The nearest surface water to the Site is the River Thames located 337m north of the Site.

According to the Ecological Potential under the Water Framework Directive, the Environment Agency (EA) has not classified the surface water body. There are 19 recorded surface water discharge consents within a 1km radius of the Site, the closest active license is located 505m northeast of the Site at the Tate Modern and involves the use of a ground source heat pump from groundwater and discharge to land.

There are 4No. surface water abstractions from tidal sources within a 1km radius of the Site. The nearest surface water abstraction is registered to BT Ground Plc and involves the abstraction of tidal water for other industrial/commercial/public services to be utilised as a heat pump.

There are 12No. recorded pollution incidents to surface waters within a 1km radius of the Site which are classified as either Category 3 - minor incident, or Category 2 - significant incident. The nearest pollution incident is recorded 383m north of the Site at Blackfriars Bridge which involved an unknown substance in 1995. Numerous pollution incidents have been recorded to have involved oils.

The risk of surface water flooding (tidal and fluvial) is shown in Figure 4 below:

Figure 4: Flood Risk

Source: Flood Map – Landmark Envirocheck Report Ref. 69899465_1_1

According to the EA's indicative flooding data, the Site is located in an area of fluvial flooding/on a flood plain. There are recorded flood defences in the area. Significant areas surrounding the Site benefit flood defences protecting against flooding of the River Thames.

A Flood Risk and Drainage Briefing Note has been completed for the Site, for further details on the flood risk of the Site refer to Report Ref. WIB15605-100-9-1-32-YN.

4.4.2 Groundwater

According to the groundwater vulnerability information contained within the Envirocheck report, the geological deposits underlying the Site are classified as per Table 4:

Table 4: Summary of hydrogeological properties of the main geological strata

Stratum	EA Classification	Hydrogeological Significance
Alluvium	Secondary Undifferentiated	May be important in supporting local abstractions or in providing baseflow to rivers and streams
London Clay Formation	Unproductive Strata	Contains insignificant quantities of vertically or laterally extensive groundwater

The Site is not located within a groundwater Source Protection Zone.

Based on available information, it is anticipated that groundwater flow will be in a north-easterly direction towards the River Thames which flows towards the east.

There are 27No. recorded groundwater abstractions within a 1km radius of the Site, the closest of which is located 189m north of the Site at Stamford House. The license is registered to Beetham Landmark London Ltd for the abstraction of groundwater for drinking, cooking, sanitary and washing purposes.

There are no recorded pollution incidents to groundwater within a 1km radius of the Site.

Overall, therefore, data suggests that underlying groundwater quality is likely to be of good quality.

4.5 Ecological Systems

The Landmark Envirocheck Report identified that there are no sensitive ecosystems within a 1km radius of the Site.

4.6 Consultations

The agencies and individuals which have been contacted and/or their records reviewed during the course of this study are listed in Table 5.

Table 5: List of parties consulted during this study

Organisation	Consultee	Response
Southwark Council		
Environmental Health		Awaited
Planning	Online	Received
Building Control		Awaited
London Fire Brigade		
Petroleum Officer		Awaited

4.6.1 Environmental Health

Information has been requested from the Environmental Health Officer (EHO) but a response is currently pending.

4.6.2 Planning Department

Consultation with Southwark Council's online planning portal revealed two planning applications pertaining to the Site. The applications are as follows:

- 12/AP/1462 – Two new air-conditioning units on rear roof – Approved (May 2012); and,
- 11/AP/3788 – New condensing units to be installed in the location of two previously removed condensing units – Approved (November 2011).

4.6.3 Building Control Department

Information has been requested from Building Control Department but a response is still pending.

4.6.4 Petroleum Officer

Information has been requested from the Petroleum Officer at the London Fire Brigade but a response is still pending.

5. Hazard Assessment and Preliminary Conceptual Model

The Preliminary Conceptual Model for the Site is presented in Table 7 below and graphically in Figure A3A in Appendix A. The risk rating included in Table 7 has been assessed qualitatively using the criteria given in Appendix E.

5.1 Contaminants of Concern

Contaminants of concern identified above are summarised in Table 6.

Table 6: Contaminants of concern

Source	Associated Contaminants
On-site (current) – Fuel storage tanks & Car parking	Total Petroleum Hydrocarbons (TPH)
Electrical Sub station	Polychlorinated Biphenyls (PCBs)
On-site (historic) Fuel storage tanks & Smithy	Total Petroleum Hydrocarbons (TPH)
Smithy	Polycyclic Aromatic Hydrocarbons
Smithy	Heavy Metals
Smithy	Asbestos
Smithy	Polychlorinated Biphenyls (PCBs)
Off-site (current) Electrical Sub station	Polychlorinated Biphenyls (PCBs)
Car parking / Railway Line	Polycyclic Aromatic Hydrocarbons
Railway Line	Creosote
Railway Line	Herbicides
Railway Line	Metal Fines
Railway Line	Ash
Railway Line	Sulphate
Off-site (historic)	Metals
Saw Mill	Pentachlorophenol
Printing Works	Inorganic Ions
Printing Works	Acids
Printing Works	Organic Solvents
Printing Works	Polycyclic Aromatic Hydrocarbons
Printing Works	Total Petroleum Hydrocarbons (TPH)

Table 7: Preliminary Conceptual Model for the Site

Potential Sources	Pathways	Receptors	Risk	Justification / Mitigation	Residual Risk
Human Health					
Contamination in soil and groundwater associated with recent and historical use of the Site	Dermal contact Ingestion inhalation	Future Site Users	Medium	<p>The historical use of the Site comprises a depot / warehouse, residential and commercial properties, a yard and a smithy, which are considered to collectively represent a medium risk with regard to potential contaminants.</p> <p>The proposed development at the Site comprises, in the majority, building footprint and areas of hardstanding. However, the risk is considered to be medium.</p> <p>Further ground investigation is recommended on Site, to inform the scope of any remedial measures necessary. Such measures are likely to include the provision of clean capping layers in areas of soft landscaping.</p>	Low
		Offsite residents / users	Low	Dusts/ vapours are considered unlikely to be generated at significant enough concentrations to migrate off-site and cause harm. Risks during the construction phase can be managed by use of appropriate working practices.	Low
		Construction Workers	Medium	<p>Based on the historical use of the Site, contaminants may pose a risk to construction workers during redevelopment.</p> <p>However, it is considered that such risks can be managed through use of appropriate working practices and protective equipment.</p>	Low
Ground Gas	Inhalation Migration	Future Site Users Offsite residents/users	Medium	<p>The Site is underlain by alluvial deposits which includes the potential for peat, which can generate methane. The Site is not located in an area of elevated radon above the action levels.</p> <p>Ground gas monitoring is recommended to be used to inform the need for ground gas protection measures in the proposed development.</p>	Low
Property					
Contamination in soil and groundwater	Direct Contact	Onsite structures and services	Medium	Given the historical use of the Site, the potential for contamination does exist within the soil and groundwater underlying the Site. The risk to buried concrete and services should be assessed via a site investigation.	Low

Potential Sources	Pathways	Receptors	Risk	Justification / Mitigation	Residual Risk
associated with recent and historical use of the Site				Concrete should be designed on basis of investigation findings, which will reduce any risk to onsite structures and services to low.	
Controlled Waters					
Contamination in soil and groundwater associated with recent and historical use of the Site	Leaching Migration Preferential pathways	Secondary Undifferentiated	Medium	Given the historical use of the Site, the potential for contamination does exist within the soil and groundwater underlying the Site. It is noted that one license for groundwater abstraction for potable use is recorded approximately 190m north of the Site. As such, further assessment of groundwater quality should be undertaken as part of a ground investigation. Where necessary, risks to groundwater may be addressed via removal of contaminated soils during development.	Low
Contamination in soil and groundwater associated with recent and historical use of the Site	Leaching Migration Preferential pathways	River Thames	Low	Given the historical use of the Site, the potential for contamination does exist within the soil and groundwater underlying the Site. However, given the historical uses, the size of the Site and the distance of greater than 300m to the River Thames. The Site is not considered to pose a significant risk to the sensitive surface water receptor.	Low

6. Conclusions

A Preliminary Environmental Risk Assessment has been undertaken to support the full planning application for 41 – 45 Blackfriars Road, London and included a review of the Site's history and inspection of its current condition. It is proposed to demolish the existing structure and build a new high-quality part 12, part 20 storey office building with a single basement.

The Site is currently a nine storey office block. Limited potential sources of contamination have been identified on site, including a generator with diesel oil drums, and car parking. Offsite sources of note included an electrical substation which was located on the western face of the building fronting onto Colombo Street. Historical uses of the Site has included a depot, smithy and a warehouse.

The Site from the date of the first available map was occupied by terraced properties. A smithy and yard were later denoted in the north of the Site. The Site was cleared prior to 1938 and was denoted as a depot and later a warehouse. The Site was finally redeveloped with Friar's Bridge Court denoted on mapping from 1991.

The geology underlying the Site recorded to comprise of a significant thickness of alluvial deposits (sand, silt, clay and peat), underlain by the London Clay Formation. There is likely to be a thickness of Made Ground within certain areas of the Site.

There is considered to be a medium to high risk of unexploded ordnance (UXO) at the Site.

The Site is underlain by a Secondary Undifferentiated aquifer associated with the alluvial deposits. The aquifer represents a potentially sensitive receptor that may be impacted by contaminants from site sources. It may also act as a pathway facilitating the on-site and off-site migration of contaminants. A groundwater abstraction license for potable use is recorded to be in place approximately 190m north of the Site. The strata in which the groundwater is abstracted is unknown. The River Thames is located 337m north of the Site.

Based on the Preliminary Conceptual Site Model, potentially unacceptable pollutant linkages have been identified as follows:

- Construction workers may be exposed to contaminants in shallow soils and groundwater beneath the Site;
- Future Site users / offsite residents may be exposed to ground gas generated beneath the Site;
- Shallow contaminants may pose a risk to buried services and structures; and
- Contaminants in Made Ground may impact upon the Secondary Undifferentiated aquifer via leaching.

The Preliminary Conceptual Site Model indicated that the highest risk estimated for potential pollutant linkages was Medium. This rating was given to four of seven potential pollutant linkages.

The proposed development of the Site will consist of the demolition of the existing building and the building of a new high-quality commercial building for office use, given this the overall risk rating for the Site is considered to be Medium.

The recommendations of this report outline preliminary remedial and mitigation measures that require confirmation through additional works. However, once successfully implemented the risks are anticipated to be Low. Therefore the NPPF requirement that on completion the Site can no longer be captured under the Part IIA regime is expected to be met.

7. Recommendations

The following actions are recommended to address the potentially unacceptable risks identified:

- An intrusive investigation and assessment of the Site is recommended, which should include soil sampling, ground gas monitoring, groundwater sampling. This will enable an assessment to be made on whether contaminants present on Site pose a potential risk to the proposed end-users or controlled waters;
- A geotechnical investigation and assessment should be completed in tandem with the intrusive investigation to inform foundation design. Sulphate and pH testing should also be incorporated into the geotechnical investigation, to inform the design of buried concrete against chemical attack;
- It is proposed that the basement area is extended as part of the redevelopment therefore a waste soils assessment should be included within the ground investigation scope. Waste acceptance criteria (WAC) testing may then be necessary, where disposal is proposed.
- Unexploded Ordnance mitigation measures should be implemented at relevant stages of the development, as detailed in the Alpha Associates report (Ref. P4975);
- A Remediation Strategy is likely to be required as a condition of planning, this will outline the mitigation measures required to mitigate the risks to human health and/or controlled waters. The remediation strategy should be compiled by a suitably qualified professional, and followed by a corresponding verification report;
- Due to the age of the building it is likely that potential Asbestos Containing Materials are present within the building and below ground services. A suitable asbestos survey should be undertaken prior to the buildings demolition; and,
- The Secondary Undifferentiated aquifer is present at shallow depths beneath the Site. Consequently care should be taken not to introduce contamination to the ground during the construction works at the Site.

GLOSSARY

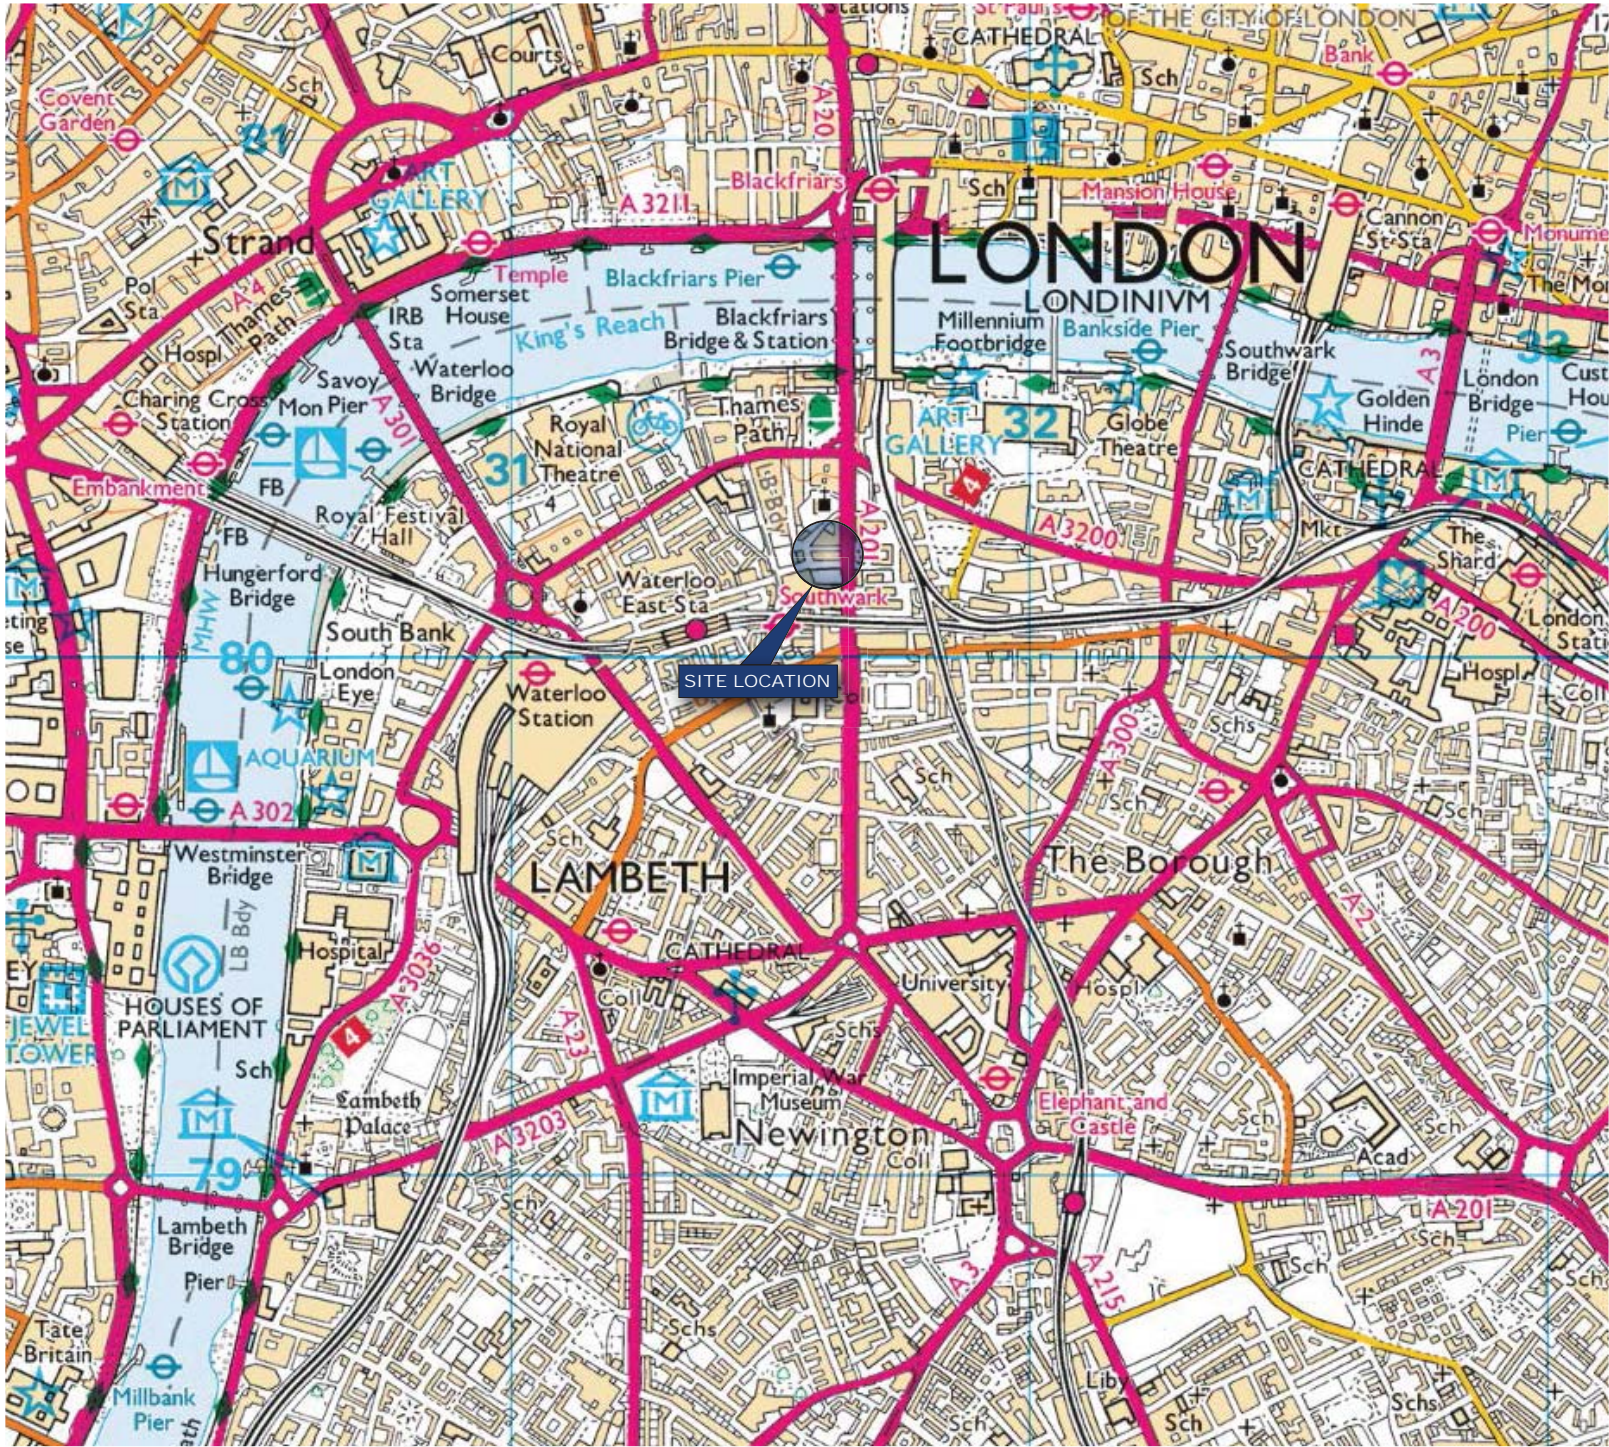

For the purpose of this report, the following terms and definitions apply (see BS 10175:2001).

Accuracy	Level of agreement between true value and observed value.
Conceptual Exposure model	<p>Textual and or schematic hypothesis of the nature and sources of contamination, potential migration pathways (including description of the ground and groundwater) and potential receptors, developed on the basis of the information from the preliminary investigation and refined during subsequent phases of investigation and which is an essential part of the risk assessment process.</p> <p>Note 1: The conceptual exposure model is initially derived from the information obtained by the preliminary investigation. This conceptual model is used to focus subsequent investigations, where these are considered to be necessary, in order to meet the objectives of the investigations and the risk assessment. The results of the field investigation can provide additional data that can be used to further refine the conceptual model.</p>
Contamination	<p>Presence of a substance which is in, on or under land, and which has <u>the potential</u> to cause significant harm or to cause significant pollution of controlled water.</p> <p>Note 1: There is no assumption in this definition that harm results from the presence of the contamination.</p> <p>Note 2: Naturally enhanced concentrations of harmful substances can fall within this definition of contamination.</p> <p>Note 3: Contamination may relate to soils, groundwater or ground gas.</p>
Controlled water	<p>Inland freshwater (any lake, pond or watercourse above the freshwater limit), water contained in underground strata and any coastal water between the limit of highest tide or the freshwater line to the three mile limit of territorial waters.</p> <p>Note 1: See Section 104 of The Water Resources Act 1991.</p>
Harm	Adverse effect on the health of living organisms, or other interference with ecological systems of which they form part, and, in the case humans, including property.
Hazard	Inherently dangerous quality of a substance, procedure or event.
Pathway	Mechanism or route by which a contaminant comes into contact with, or otherwise affects, a receptor.
Precision	Level of agreement within a series of measurements of a parameter.
Receptor	Persons, living organisms, ecological systems, controlled water, atmosphere, structures and utilities that could be adversely affected by the contaminant(s).
Risk	Probability of the occurrence, magnitude and consequences of an unwanted adverse effect on a receptor.
Risk assessment	Process of establishing, to the extent possible, the existence, nature and significance of risk.
Sampling	Methods and techniques used to obtain a representative sample of the material under investigation.
Soil	<p>Upper layer of the earth's crust composed of mineral parts, organic substance, water, air and living matter.</p> <p>Note 1: In accordance with BS 10175:2001 the term soil has the meaning ascribed to it through general use in civil engineering and includes topsoil and subsoil; deposits such as clays, silt, sand, gravel, cobbles, boulders and organic deposits such as peat; and material of natural or human origin (e.g. fills and deposited wastes). The term embraces all components of soil, including mineral matter, organic matter, soil gas and moisture, and living organisms.</p>
Source	<p>Location from which contamination is, or was, derived.</p> <p>Note 1: This could be the location of the highest soil or groundwater concentration of the contaminant(s).</p>
Uncertainty	Parameter, associated with the result of a measurement that characterizes the dispersion of the values that could reasonably be attributed to the measurement.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

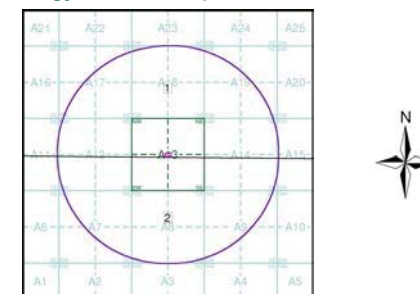

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

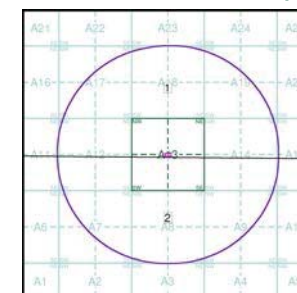

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

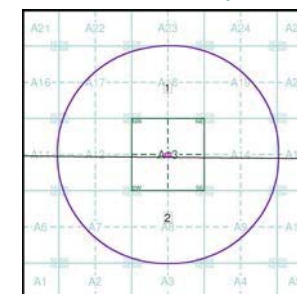

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.
