

Physical Security Risk Assessment

According to HG Nr.301/2012, the adoption of security measures for the objectives, goods and values prescribed by law is based on a physical security risk assessment. Physical security risk analysis comprises the assessment and treatment of physical security risks and, where appropriate, a specific rating scale for the object of activity.

The assessment and treatment report of physical security risks includes:

- nominating the unit, the object of its activity and the evaluation purpose;
- geographical location of the unit, neighborhood, access roads, other external factors affecting unit's activity;
- the internal organizational policies and responsibilities for physical security of the beneficiary unit;
- sources of risk to physical security, impact areas, past events and the causes for the identified risks for the assessed unit and also possible consequences for individuals and business continuity;
- identified risks analysis;
- physical security risks assessment;
- establishing the structural, technical, technological and operational requirements, measures and security arrangements for the system to be implemented;
- the conclusions of the report, which proposes one or more options to manage risk so the risk is considered acceptable in the field of physical security, specifying the guard personnel dimension, specific areas or electronically controlled points with video surveillance, intrusion detection, control access and alarm, elements of mechanical and physical protection and other measures.

What recommend us:

- Our specialists in physical security are registered members of R.N.E.R.S.F.
- The 10 years experience of our specialists in the field of physical security
- Effective performance of our customers requirements
- Quality-price ratio
