

KIDS ENVIRONMENTAL LESSON PLANS

This lesson plan developed by:

North American Marine Environment Protection Association®

Symbiosis

Overview:

In this lesson, students learn about different types of symbiotic relationships between organisms and how those relationships benefit, have no effect on, or negatively affect certain organisms. Using the NAMEPA symbiosis cards, students will explore different symbiotic relationships between organisms and have to match their organism to its symbiont.

Ocean Literacy Principles:

5. The ocean supports a great diversity of life and ecosystems
6. The ocean and humans are inextricably interconnected

Key Concepts:

Students will:

- learn about symbiosis and different relationships between organisms
- discuss the role these relationships play in ecosystem health

Materials:

- NAMEPA Symbiosis Cards (one for every student)
- White board (optional)

Set-up Prior to Activity:

- Print and cut out NAMEPA Symbiosis Cards

Duration:

45 to 60 minutes

**Physical Activity:**

Low

Background:

Ecosystems are extremely complex systems that are made up of interrelationships between species and their environments. If organisms have a symbiotic relationship, it means they live in close physical association with one another. In many cases, symbiotic relationships are imperative to an organism's survival. There are a variety of types of symbiotic relationships. The three discussed in this lesson are mutualism, commensalism and parasitism.

Vocabulary:

- **biodiversity:** the variety of life in the world or a particular habitat or ecosystem
- **ecosystem:** a community of living things, non-living elements, and their interrelationships
- **symbiosis:** an interaction between organisms living in close physical association
- **mutualism:** a relationship between organisms that is beneficial for both organisms
- **commensalism:** a relationship between organisms where one organism benefits and the other is neither benefited nor harmed
- **parasitism:** a relationship between organisms where one organism benefits and the other is harmed

Activity:

Engage/Elicit

1. Begin the activity by asking the students what an ecosystem is. After taking answers, explain to them that an ecosystem is "a community of living things, non-living things and their interrelationships."
2. Ask the students what types of relationships organisms have with each other. Answers may include predator-prey, parent and offspring, etc. If they have some difficulty with the question, prompt them by asking if there are some organisms that live near or on each other? How do they interact with one other? The term "symbiosis" may be unfamiliar to the students, so shift the discussion in that direction by providing an example, i.e. a crocodile and Plover Bird. They have a symbiotic, mutualistic relationship, meaning they both benefit from each other. The Plover eats parasites and leftover food in the crocodile's mouth. The bird gets food, while the crocodile gets its mouth cleaned. Mutualists can be described as "teammates," commensalists as "neighbors," and parasites as "thieves." You may want to write these terms on the board.

Explore

1. After going over each of the terms, shuffle the Symbiosis Cards and give one to each student (if there is an odd number of students, give yourself a card, ensuring everyone has a symbiont).
2. Once everyone has a card, explain to the students that someone else in the class has a symbiotic relationship with them, and that they should find their "symbiont" by talking to other group members about what their organism has or needs. If students think they have found their symbiont, have them check that it is correct and then write their organisms on the board with a circle around it.

Discussion:

Explain

1. Once all of the pairs are written on the board, have students talk in pairs or small groups about what type of symbiotic relationship they believe those organisms have. Is it mutualism, commensalism or parasitism? To assist them, the descriptions on each card can be read aloud to the class.
2. To take this further, students can even create their own examples of symbiotic relationships with made up organisms and share them with their peers.

Evaluate/Wrap-up

1. After determining what type of symbiotic relationship each of the students have with their symbiont, initiate a discussion about symbiosis and ecosystems.
For example, you may ask:
 - What could happen to an organism if its “symbiont” went extinct?
 - How do you think symbiotic relationships affect the health of an ecosystem?
 - What do you think are some characteristics of healthier ecosystems?
2. It is important to stress that if one organism is threatened or endangered, it can directly (and indirectly) affect the presence of many other organisms in that ecosystem. All species in an ecosystem are connected, and maintaining those relationships is crucial to the sustainability of that ecosystem. Generally speaking, healthy ecosystems will have a greater variety of organisms, or biodiversity.

Additional Resources:

Dive Deeper: NOAA’s Coral Reef Conservation Program is a great resource to research and understand the immense value of coral reef ecosystems to the health of our oceans and our planet as a whole. Visit NOAA’s website to learn more about the symbiotic relationship between coral and the microscopic organisms, zooanthellae, that help them survive: www.coralreef.noaa.gov/aboutcorals/coral101/symbioticalgae/

Further Your Impact with Sailors for the Sea Powered by Oceana:

As sailors and water-lovers, you are among the first to notice changes to our seas such as fewer marine animals, more pollution and damaged marine habitat. Through our Green Boating initiative, Sailors for the Sea Powered by Oceana provides opportunities for you and your community to address pressing ocean health issues. As a Green Boater, you will be provided with the information, resources and access to combat marine plastic pollution, prevent habitat destruction, source responsible seafood and protect marine animals. From demanding plastic-free alternatives to choosing sustainable seafood, your voice and actions are an important part of restoring the abundance of our oceans and protecting marine habitats. [Join our growing Green Boating Community today.](#)

ANSWER LIST:

Anemone & Clownfish (mutualism) - Clownfish is protected by anemone and receives food scraps, anemone is defended from predators and parasites

Barnacle & Whale (commensalism) - Barnacle latches onto whale and benefits when whales swim into plankton-rich waters to feed

Whale Shark & Remora (commensalism) - Remora travels with shark & eats scraps, shark is unaffected

Spider Crab & Algae (mutualism) - Algae lives on crab's back, helping crab blend into environment

Cleaner Shrimp & Grouper (mutualism) - Cleaner shrimp consumes organisms and parasites in grouper's mouth

Shrimp & Bubble Coral (commensalism) - Shrimp uses bubble coral for camouflage and protection in coral crevices

Fish Lice & Salmon (parasitism) - Fish serves as host for lice

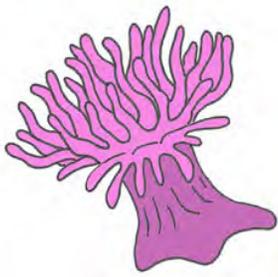

Crab & Sea Urchin (commensalism) - Crab holds sea urchin and uses it for protection

Sea Lamprey & herring (parasitism) - Sea lamprey attaches to host, feeding on it

Blind Shrimp & Goby (mutualism) - Shrimp gets protection from Goby who keeps an eye on predators, Goby uses shrimp's burrow for protection from predators

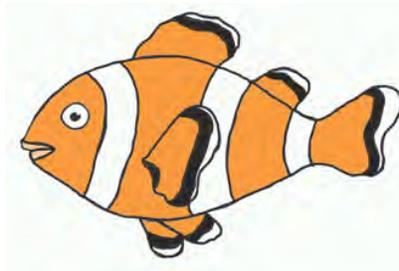

Eagle Ray & Jack (commensalism) - Eagle ray digs up sand to get to shellfish, Jack eats small fish that are exposed as a result

Coral & Zooxanthella Algae (mutualism) - Coral provides algae with protected environment and CO₂, algae produce oxygen and help the coral remove wastes

ANEMONE

- Has stinging tentacles that ward away predators
- Provides place to live

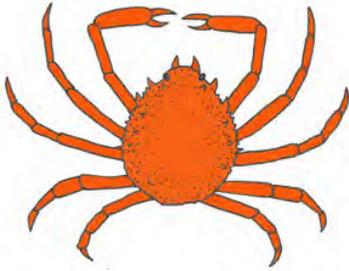

CLOWNFISH

- Needs place to live that provides protection

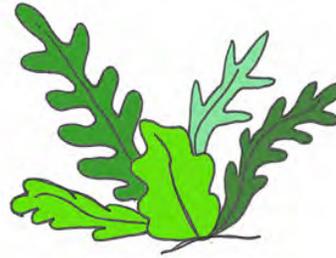

BARNACLE

- Filter feeder that depends on availability of plankton for food
- Latches on to moving organisms

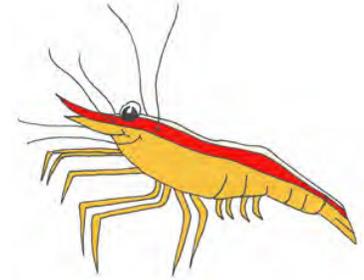

SPIDER CRAB

- Needs protection from predators
- Uses camouflage to blend into the environment

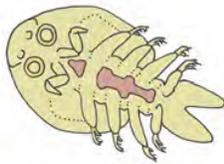

ALGAE

- Tends to grow on stationary things, but can also grow on certain animals, camouflaging them from predators

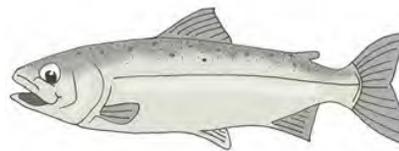

CLEANER SHRIMP

- Eats parasites and organisms from the mouths of fish

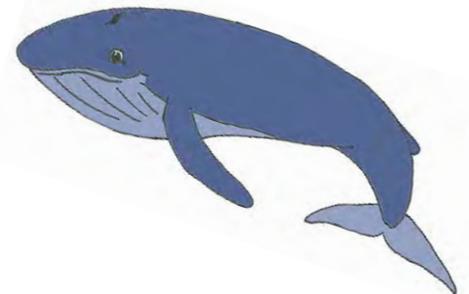

FISH LICE

- Feeds off of skin and blood of fish

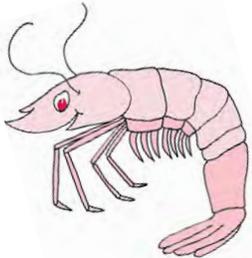

SALMON

- Saltwater fish that has skin and blood that certain organisms feed off of

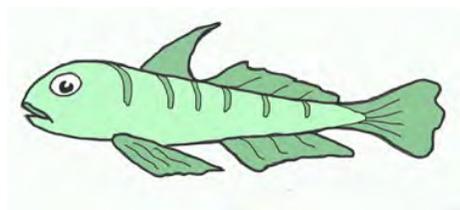

WHALE

- Large mammal that often swims into plankton-rich waters to feed

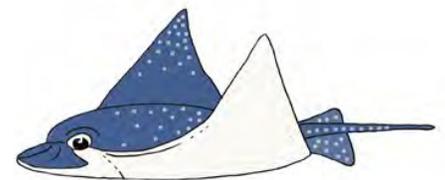

BLIND SHRIMP

- Needs help keeping an eye out for predators
- Digs burrows for protection from predators

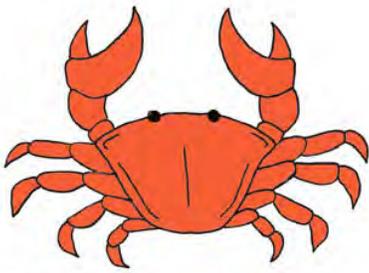

GOBY

- Good at keeping an eye out for predators
- Needs a place for protection

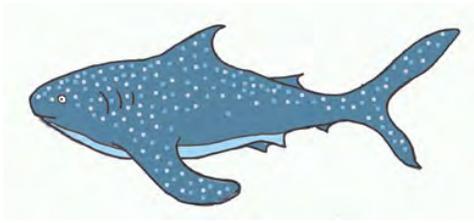

EAGLE RAY

- Digs up sand to find shellfish to eat, exposing smaller fish

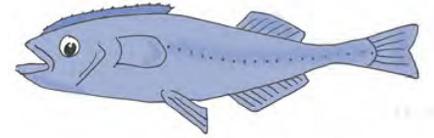

CRAB

- Has claws it can use to hold things
- Needs protection from predators

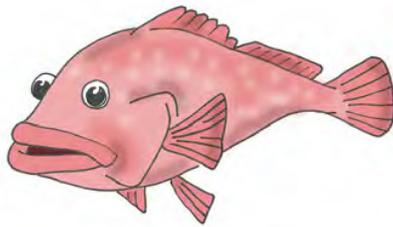

WHALE SHARK

- Leaves scraps of food behind while feeding

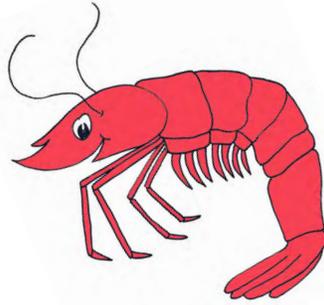

REMORA

- Consumes scraps of food left behind from other organisms

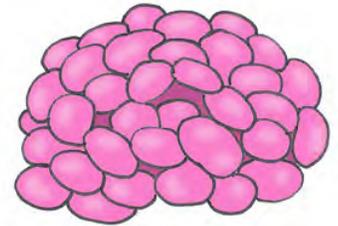

GROUPE

- Has parasites and organisms in its mouth

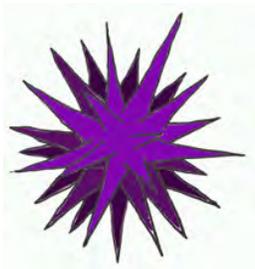

SHRIMP

- Needs protection from predators
- Can use camouflage by hiding

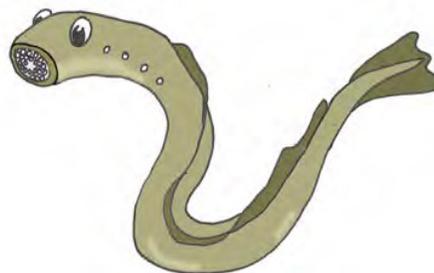

BUBBLE CORAL

- Provides place for smaller organisms to hide or blend in

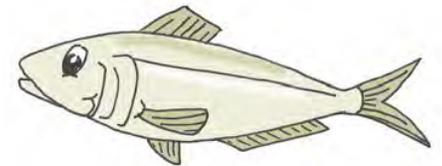

SEA URCHIN

- Has spines that shields it from predators
- Can be transported by other organisms

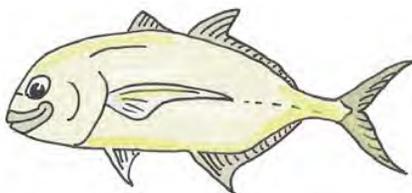

SEA LAMPREY

- Feeds on fish by using its mouth to attach to its host
- Consumes blood

HERRING

- Saltwater fish that contains blood

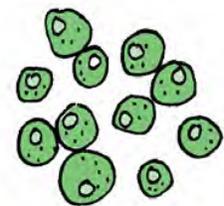

JACK

- Eats small fish that hide in the sand

CORAL

- Produces Carbon Dioxide
- Needs Oxygen
- Provides hard, protected environment for organisms

ZOOXANTHELLA ALGAE

- Produces Oxygen
- Needs Carbon Dioxide
- Needs hard place to live for protection
