AP[®] CALCULUS BC 2008 SCORING GUIDELINES (Form B)

Question 3

Distance from the river's edge (feet)	0	8	14	22	24
Depth of the water (feet)	0	7	8	2	0

A scientist measures the depth of the Doe River at Picnic Point. The river is 24 feet wide at this location. The measurements are taken in a straight line perpendicular to the edge of the river. The data are shown in the table above. The velocity of the water at Picnic Point, in feet per minute, is modeled by $v(t) = 16 + 2\sin(\sqrt{t+10})$ for $0 \le t \le 120$ minutes.

- (a) Use a trapezoidal sum with the four subintervals indicated by the data in the table to approximate the area of the cross section of the river at Picnic Point, in square feet. Show the computations that lead to your answer.
- (b) The volumetric flow at a location along the river is the product of the cross-sectional area and the velocity of the water at that location. Use your approximation from part (a) to estimate the average value of the volumetric flow at Picnic Point, in cubic feet per minute, from t = 0 to t = 120 minutes.
- (c) The scientist proposes the function *f*, given by $f(x) = 8\sin\left(\frac{\pi x}{24}\right)$, as a model for the depth of the water, in feet, at Picnic Point *x* feet from the river's edge. Find the area of the cross section of the river at Picnic Point based on this model.
- (d) Recall that the volumetric flow is the product of the cross-sectional area and the velocity of the water at a location. To prevent flooding, water must be diverted if the average value of the volumetric flow at Picnic Point exceeds 2100 cubic feet per minute for a 20-minute period. Using your answer from part (c), find the average value of the volumetric flow during the time interval $40 \le t \le 60$ minutes. Does this value indicate that the water must be diverted?

(a)
$$\frac{(0+7)}{2} \cdot 8 + \frac{(7+8)}{2} \cdot 6 + \frac{(8+2)}{2} \cdot 8 + \frac{(2+0)}{2} \cdot 2$$

$$= 115 \text{ ft}^{2}$$
(b)
$$\frac{1}{120} \int_{0}^{120} 115v(t) dt$$

$$= 1807.169 \text{ or } 1807.170 \text{ ft}^{3}/\text{min}$$
(c)
$$\int_{0}^{24} 8\sin\left(\frac{\pi x}{24}\right) dx = 122.230 \text{ or } 122.231 \text{ ft}^{2}$$
(d) Let *C* be the cross-sectional area approximation from part (c). The average volumetric flow is

$$\frac{1}{20} \int_{0}^{60} C \cdot v(t) dt = 2181.912 \text{ or } 2181.913 \text{ ft}^{3}/\text{min}.$$
Yes, water must be diverted since the average volumetric flow for this 20-minute period exceeds 2100 ft³/min.

Work for problem 3(a)
Trapervidal sum =
$$piquit sum + left sum$$

Right sum = $(2 \cdot 0) + (8 \cdot 2) + (6 \cdot 8) + (8 \cdot 7)$
= 120
left sum = $(8 \cdot 0) + (6 \cdot 7) + (8 \cdot 8) + (2 \cdot 2)$
= 110
Trapervidal sum = $\frac{120 + 110}{2} = 115$ square feet

Do not write beyond this border.

Work for problem 3(b)

$$Flow = 115 \cdot V(t)$$

 $= 115 \cdot V(120)$
 $= 115 \cdot 14.1627263406$
 $= 1628.714 \text{ cubic feet per minute}$

Continue problem 3 on page 9.

AP[®] CALCULUS BC 2008 SCORING COMMENTARY (Form B)

Question 3

Sample: 3A Score: 9

The student earned all 9 points.

Sample: 3B Score: 6

The student earned 6 points: 1 point in part (a), no points in part (b), 2 points in part (c), and 3 points in part (d). The student presents correct work in parts (a), (c), and (d). In part (b) the student does not produce an integral, which is needed in order to find the average value of volumetric flow.

Sample: 3C Score: 3

The student earned 3 points: 1 point in part (a), no points in part (b), 2 points in part (c), and no points in part (d). The student presents correct work in parts (a) and (c). In part (b) the student does not produce an integral to find the average value and thus did not earn any points. In part (d) the student also does not produce an integral and did not earn any points. Although the student's statement that the water "must be diverted" is true, the student does not present enough correct calculus work leading up to the answer to earn the answer point.
