#### Question 1

#### **General Considerations**

- 1. Answers must be presented in sentences, and sentences must be cogent enough for the student's meaning to come through. Spelling and grammatical mistakes do not reduce a student's score, but spelling must be close enough so that the reader is convinced of the word.
- 2. Do not score students' notes made on the question section of the booklet. Score only what has been written in the blanks provided in the booklet.
- 3. Within a point, a student will not be penalized for misinformation unless it *directly contradicts* correct information that would otherwise have scored a point.
- 4. A student can score points only if the student clearly conveys what part of the question is being answered. For example, it is possible to infer the part of the question being answered if it is consistent with the order of the question.
- 5. Rubric examples provided for each point are not to be considered exhaustive.

#### Point 1: Describe the levels of the independent variable.

- A. To earn this point, the student must identify the high power **AND** the low power condition, **OR**
- B. The student must describe the levels as recalling a time when the participant had power over someone else **AND** a time when another person had power over them.

#### Point 2: Describe how the researchers measured the dependent variable.

- A. To earn this point, the student must state that the dependent variable is measured by the height of the participant's visual representation (e.g., the electronic graphical image, an avatar, image, or figure).
- B. The student must be clearly referring to a visual image, not self-concept.

#### Examples:

Do not score "bigger" or "size" as it may not refer to height.

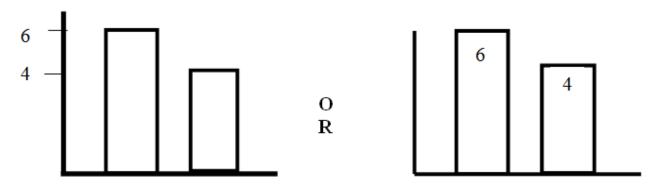

<u>Do not score</u> "perception of height" because there must be a reference to the participant's visual representation.

## Question 1 (continued)

## Point 3: Create a bar graph illustrating the results of the study.

A. To earn this point the student must correctly plot the means, 6 and 4.

Examples:

 $\underline{\text{Do not score}}$  if the student draws more than 2 bars, unless there are two additional bars that are explicitly graphing the standard deviation (1.5, 1).

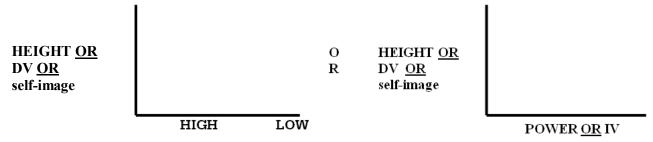

<u>Do not score</u> if the student labels low-power condition as 6 and high-power condition as 4.

## Question 1 (continued)

## Point 4: Correctly label each axis.

A. To earn this point, the student must label the X axis as the IV **OR** power (high, low) and the Y axis as the DV **OR** height.

Examples:

<u>Do not score</u> "size" on the Y axis because size may not be referring to height.

#### Question 1 (continued)

# Point 5: Explain why the researchers can conclude that there is a cause-and-effect relationship between the independent and dependent variables.

- A. The student can earn this point by indicating that participants were randomly assigned **OR**
- B. The student identities this study as an experiment **OR**
- C. The student states specifically that the researcher manipulated the independent variable (power condition) in the study.

#### Note:

Any description of what the researcher did without explicitly using the term "manipulation" will not score.

#### Examples:

<u>Do not score</u> if the student only uses the results of the study as the demonstration of cause and effect.

Do not score "random selection."

#### Point 6: Explain what statistical significance means in the context of the study.

- A. To earn this point the student must explain that if the results of this study are statistically significant, then the results are *not* likely to have occurred by chance (are not random), **OR**
- B. That there is a high probability that the independent variable caused changes in the dependent variable.

#### Examples:

Score "The results are not due to chance."

Do not score "it is due to the IV" because the student is not referring to chance.

#### Question 1 (continued)

### Point 7: Explain why debriefing would be necessary in the study.

- A. To earn this point the student must explain that debriefing is necessary because deception was used in the study **OR**
- B. The student must describe the deception as "participants believing they were participating in a business simulation" or "participants were not told that researchers were actually measuring self-image" **OR**
- C. The student must explain that debriefing minimizes any negative impact on the participants of the power conditions.

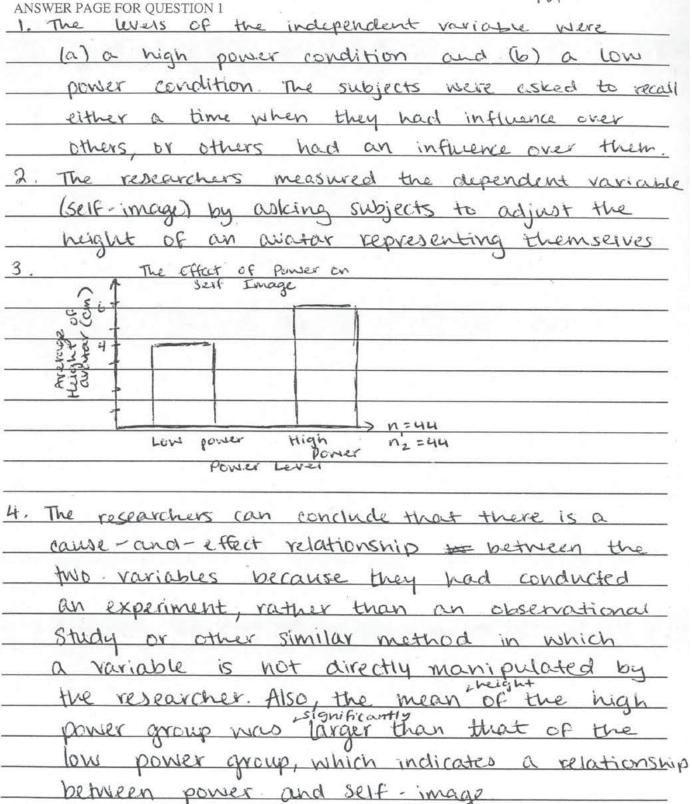

#### Examples:

<u>Do not score</u> synonyms for deception (e.g., "lied," "misled") without a description of the deception (i.e., "believing they were participating in a business simulation" or "not told that researchers were actually measuring self-image").

<u>Do not score</u> "participants were not told the true purpose of the study" without a description of the deception (i.e., "believing they were participating in a business simulation" or "not told that researchers were actually measuring self-image").

<u>Do not score</u> a general explanation that "experimenters must debrief after a study" or that "ethical guidelines require debriefing" without referring to deception or the negative impact of being assigned to one of the power conditions.

<u>Do not score</u> answers that only provide justifications for using deception.

#### Question 1 is reprinted for your convenience.

- 1. Adapted from M. M. Duguid and J. A. Goncalo, Living Large: The Powerful Overestimate Their Own Height. In a study of power and self-image, participants were not told the true purpose of the study; instead, they believed they were participating in a business simulation. Researchers randomly assigned participants to a high-power (n = 44) or low-power (n = 44) condition. In the high-power condition, participants recalled a time when they had power over others, and in the low-power condition, they recalled a time when others had power over them. Participants were asked to adjust the height (in centimeters) of an electronic graphical image (an avatar) of themselves to reflect their personal appearance. Results indicated a statistically significant difference in participants' perceptions of their own height across the two conditions. Participants in the high-power condition created taller self-images (mean = 6.0, standard deviation = 1.5) than participants in the low-power condition (mean = 4.0, standard deviation = 1.0).
  - Describe the levels of the independent variable.
  - Describe how the researchers measured the dependent variable.
  - Create a bar graph illustrating the results of the study. Correctly label each axis.
  - Explain why the researchers can conclude that there is a cause-and-effect relationship between the independent and dependent variables.
  - Explain what statistical significance means in the context of the study.
  - Explain why debriefing would be necessary in the study.

5. In this case the term "statistical significance
means that the results of the experiment
[low power group had a lower mean anatour
height) were probably not due to wick!
chance. In other words, the experiment
was a most likely not a fluke.
6. Debriefing is necessary in the study to
prest preserve the ethical quidelines. In
experiments, the subjects must be
Pully aware and of the experiment's
purpose, and consent to being experimented
on for that purpose. In cases where it
Is absolutely required for the subject to
be oblivious, they must be brought

## AP® PSYCHOLOGY 2014 SCORING COMMENTARY

#### Question 1

#### Overview

This question assessed students' ability to analyze characteristics of research design and their ability to create and correctly label a visual representation of research results.

Students were required to describe the levels of the independent variable as described in the question. The question also assessed the students understanding of how researchers measure a dependent variable. It was also necessary for students to create a bar graph, including the labeling of each axis, illustrating the results of the study. Students had to explain why researchers can draw cause and effect conclusions between the independent and dependent variables. The question also assessed how well students comprehend statistical significance within the context of a specific study and why debriefing is necessary in research studies that include deception.

Sample: 1A Score: 7

This essay scored point 1 because the student refers to the high power and lower power conditions. Point 2 scored when the essay explained that the dependent variable was measured by adjusting "the height of an avatar." Point 3 scored because the essay provides two bars indicating that one represents a mean of 4 and the other a mean of 6. Point 4 scored because the X axis is correctly labeled "Low power" and "High power," as well as the Y axis correctly labeled "Average height of avatar (cm)." Point 5 scored because the essay explains that "because they had conducted an experiment." Point 6 scored because the essay explains that the results "were probably not due to luck/chance." Point 7 scored because the essay explains that it was necessary to debrief the participants, "Otherwise, the subjects will continue to believe that they had only been participating in a business simulation."

Sample: 1B Score: 4

This essay scored point 1 because the student correctly identifies both the high and low power conditions. Point 2 scored because the essay states that the dependent variable is measured by height ("how tall") of the participant's visual representation ("simulated character"). Point 3 scored because the essay provides two bars indicating that one represents a mean of 6 and the other a mean of 4. The essay also provides two bars representing the standard deviation. The essay still scored this point because these bars were clearly labeled as the standard deviation. Point 4 scored because the X axis is correctly labeled as "high power" and "low power" as well as the Y axis correctly labeled "mean height." Point 5 did not score because the essay only uses the results of the study as the demonstration of cause and effect. Point 6 did not score because the essay does not explain that the results of this study, if statistically significant, are not due to chance. Point 7 did not score because, while the essay states that "participants were not informed of the purpose of the experiment," the response does not describe the deception.

Sample: 1C Score: 1

This essay scored point 1 because the student distinguishes between the "higher powers" and the "lower power group." Point 2 did not score because the essay does not identify that the dependent variable is measured by the height of the participant's visual representation. Point 3 did not score because the essay did not correctly plot the means. Point 4 did not score because the X axis is incorrectly labeled. Point 5 was not scored because the essay focuses on describing the results of the study. Point 6 did not score because
