The College Board is a not-for-profit membership association whose mission is to connect students to college success and opportunity. Founded in 1900, the association is composed of more than 4,500 schools, colleges, universities, and other educational organizations. Each year, the College Board serves over three million students and their parents, 23,000 high schools, and 3,500 colleges through major programs and services in college admissions, guidance, assessment, financial aid, enrollment, and teaching and learning. Among its best-known programs are the SAT<sup>®</sup>, the PSAT/NMSQT<sup>®</sup>, and the Advanced Placement Program<sup>®</sup> (AP<sup>®</sup>). The College Board is committed to the principles of excellence and equity, and that commitment is embodied in all of its programs, services, activities, and concerns.

A.

5. A researcher thinks that modern Thai dogs may be descendants of golden jackals. A random sample of 16 animals was collected from each of the two populations. The length (in millimeters) of the mandible (jawbone) was measured for each animal. The lower quartile, median, and upper quartile for each sample are shown in the table below, along with all values below the lower quartile and all values above the upper quartile.

Sample	Values Below $Q_1$	$Q_1$	Median	$Q_3$	Values Above $Q_3$
Modern Thai dog	114, 116, 116, 120	121	125	128	129, 130, 130, 132
Golden jackal	104, 104, 105, 106	107	108	112	114, 122, 124, 125

(a) Display parallel boxplots of mandible lengths (showing outliers, if any) for the modern Thai dogs and the golden jackals on the grid below.

Based on the boxplots, write a few sentences comparing the distributions of mandible lengths for the two types of dogs.

the median of the modern thai dog mandible length is a lot higher to that of golden jackals. the range of the golden jackal, 21, is larger than that of the modern thai dog, 18. The interquartile range of the modern thai dog is greater than that of the golden jackal. The distribution of mandible lengths of the golden jackal is highly skewed to the right, while that of the modern thai dog is roughly normal, with slight skew to the left.

GO ON TO THE NEXT PAGE.

- (b) Is it reasonable to use the sample of mandible lengths of modern Thai dogs to construct an interval estimate of the mean mandible length for the population of modern Thai dogs? Justify your answer. (Note: You do not have to compute the interval.)

Yes, it is reasonable because a sample size of 16 falls in the medium sized range, and to construct an interval for a medium sized sample, the data needs to be roughly normal with few or no outliers, and that is true of the Thai dog distribution.

- (c) Is it reasonable to use the sample data of mandible lengths of modern Thai dogs and the sample data of mandible lengths of golden jackals to perform a two-sample  $t$ -test for the difference in mean mandible lengths for the two types of dogs? Justify your answer. (Note: You do not have to conduct the test.)

It is not reasonable to do a two sample  $t$  test because the distribution for the golden jackal is not roughly bell shaped and symmetric and has many strong outliers, which is unacceptable.

5. A researcher thinks that modern Thai dogs may be descendants of golden jackals. A random sample of 16 animals was collected from each of the two populations. The length (in millimeters) of the mandible (jawbone) was measured for each animal. The lower quartile, median, and upper quartile for each sample are shown in the table below, along with all values below the lower quartile and all values above the upper quartile.

Sample	Values Below $Q_1$	$Q_1$	Median	$Q_3$	Values Above $Q_3$
Modern Thai dog	114, 116, 116, 120	121	125	128	129, 130, 130, 132
Golden jackal	104, 104, 105, 106	107	108	112	114, 122, 124, 125

(a) Display parallel boxplots of mandible lengths (showing outliers, if any) for the modern Thai dogs and the golden jackals on the grid below.

Based on the boxplots, write a few sentences comparing the distributions of mandible lengths for the two types of dogs.

Modern Thai dog has more variety in its Mandible length than Golden Jackal, since IQR of Modern Thai dog is 7, whereas that of golden jackal is 5. If outliers are excluded, then range of Modern Thai dog also becomes greater than those of Jackal. Since median of Modern Thai dog is greater than the maximum of golden Jackal (excluding outliers) it is obvious that Modern Thai dog has longer mandible than golden Jackal.

- (b) Is it reasonable to use the sample of mandible lengths of modern Thai dogs to construct an interval estimate of the mean mandible length for the population of modern Thai dogs? Justify your answer. (Note: You do not have to compute the interval.)

Yes, it is reasonable, because first, there is no outlier in the sample, which lower extreme is 114 which is greater than  $Q_1 - IQR \times 1.5 = 121 - (128 - 121) \times 1.5 = 110.5$  and maximum is 132 which is less than  $Q_3 + IQR \times 1.5 = 128 + (128 - 121) \times 1.5 = 138.5$ . Also Median =  $Q_2 = 4$ ,  $Q_3 - \text{median} = 3$ , indicates that there is no strong skewedness in the sample, which is why confidence interval can be used to estimate the population mean even though sample size is only 16.

- (c) Is it reasonable to use the sample data of mandible lengths of modern Thai dogs and the sample data of mandible lengths of golden jackals to perform a two-sample  $t$ -test for the difference in mean mandible lengths for the two types of dogs? Justify your answer. (Note: You do not have to conduct the test.)

No, it isn't. Although sample of Modern Thai dogs exhibit no strong skewedness, sample of golden jackal does.

The golden jackal sample has three outliers, 122, 124 and 125 which are all greater than  $Q_3 + 1.5 IQR = 112 + (112 - 109) \times 1.5 = 119.5$ . Also  $Q_3 - \text{Median} (4)$  is greater than  $\text{Median} - Q_1$ , which indicates graph is skewed to the right. Because of outliers and skewedness,  $T$ -test using a small sample doesn't apply.

5. A researcher thinks that modern Thai dogs may be descendants of golden jackals. A random sample of 16 animals was collected from each of the two populations. The length (in millimeters) of the mandible (jawbone) was measured for each animal. The lower quartile, median, and upper quartile for each sample are shown in the table below, along with all values below the lower quartile and all values above the upper quartile.

Sample	Values Below $Q_1$	$Q_1$	Median	$Q_3$	Values Above $Q_3$
Modern Thai dog	114, 116, 116, 120	121	125	128	129, 130, 130, 132
Golden jackal	104, 104, 105, 106	107	108	112	114, 122, 124, 125

(a) Display parallel boxplots of mandible lengths (showing outliers, if any) for the modern Thai dogs and the golden jackals on the grid below.

Based on the boxplots, write a few sentences comparing the distributions of mandible lengths for the two types of dogs.

THE MANDIBLE LENGTHS FOR THE TWO TYPES OF DOGS LOOK SIGNIFICANTLY DIFFERENT FROM EACH OTHER. THE DISTRIBUTION OF MODERN THAI DOG LOOKS QUITE NORMAL WHERE AS THAT OF GOLDEN JACKAL IS SKEWED TO THE RIGHT WITH OUTLIERS @ HIGHER END.

C<sub>2</sub>

- (b) Is it reasonable to use the sample of mandible lengths of modern Thai dogs to construct an interval estimate of the mean mandible length for the population of modern Thai dogs? Justify your answer. (Note: You do not have to compute the interval.)

YES IT IS.

SINCE  $n = 16 \leq 30$ , THE T-INTERVAL NEEDS TO BE USED INSTEAD OF Z-INTERVAL. SINCE WE HAVE TO ASSUME NORMALITY FOR T-INT, AND THE DISTRIBUTION SEEMS QUITE NORMAL (FROM BOX PLOT), IT IS REASONABLE.

- (c) Is it reasonable to use the sample data of mandible lengths of modern Thai dogs and the sample data of mandible lengths of golden jackals to perform a two-sample  $t$ -test for the difference in mean mandible lengths for the two types of dogs? Justify your answer. (Note: You do not have to conduct the test.)

NO, SINCE FOR THE T-TEST, WE HAVE TO ASSUME NORMALITY. THE DISTRIBUTION OF GOLDEN JACKAL AS CAN BE SEEN IN THE BOX PLOT, IS HIGHLY SKEW TO THE RIGHT; SO THE ASSUMPTION IS UNREASONABLE.

∴, THE 2-SAMPLE T-TEST WOULD BE UNREASONABLE.
